Interesting story in one of our national dailies here in the frozen north this morning. It concerns the possibility that there are dimensions (universes) other than the 4 we live in. Height width length and time. He gets rather technical which I just sort of scanned over. His point is they may be very small which is why we can't see them. I'll put the link below for anyone who wants to wade through it.

I have long believed that heaven is a generic term for the spiritual realm which consists of "many" other dimensions. Filled with personalities we know nothing about. He thinks it is not likely. I think it is guaranteed. Anyway I found his final statement quite interesting.

. . . it does open the romantic possibility that right under our noses could be a portal into huge extra dimensions, large enough not only to fit Narnia, but to fit whole new universes with exotic physics, and maybe galaxies and civilizations that we can never connect with. It is not in the least sense likely, but what remains surprising to me is that it is also not impossible.

Ha! The thing I took away from the article is that Lawrence Krauss writes suspiciously like you Mark... a pseudonym perhaps?

<grin>

Blessings,
William
